The Pains of a New Birth

Inspiring Change to Save Life on our Planet

Our world is in pain. A crisis in values, a crisis in ethics and, above all, a crisis in leadership are spreading environmental and economic instability and disrupting global progress. How many economies must fail before our civilization buckles? How many ecosystems must be destroyed before we undertake a global commitment to mitigate **climate change, our common enemy**, reverse unemployment and inspire society with hope and joy?

The pains undergone by humanity are the pains of a new birth. The time to act is now and everyone needs to be involved. A worldwide effort to **reverse unemployment** by specifically engaging **the unemployed and youth** in environmental projects can restore the environment and help to offset the devastating consequences of job loss. **Advancing technologies** offer the world an immense potential to end global warming, but they need to be implemented immediately. **Green development** with a vision can rebuild society's economic support system and, most of all, rebuild hope. **Environmental Olympiads**, with the participation of every individual and every profession in the race to save the environment, can move the world on a path of sustainable progress. The **birth of a new society of hope** and cooperation will provide the light and guidance for our future.
